

NeuroErgonomics Lab Paid Undergraduate Research Assistant (URA) Expectations and Responsibilities

RESPONSIBILITIES:

The duties of the URA include, but are not limited to:

- Data collection, analysis, and synthesis: of an ongoing project (i.e. pHRI), an upcoming project (i.e. ICU-HAI), or a new project led by the URA.
 - Available data may include subjective measures, objective measures, neurophysiological measures, etc.
 - The type of data analysis performed may be chosen based on the interest of the student but will be developed with the mentor(s) to ensure they are scientifically rigorous and compatible with the current research aims.
 - Work of the URA may be submitted to conferences or journals based on their interest.
- Literature review and synthesis: URA will be expected to perform literature reviews resulting in synthesis across multiple papers / concepts (rather than surface level summaries), which may be used to support future, or current research projects.
 - Literature review topics may include human-robot interaction, human-AI interaction, heuristics / bias, guidelines for neurophysiological sensors, and team sciences.
- Attending / Lead Training Sessions for Physiological Sensors: Even if physiological data is not collected / processed for any of the ongoing, upcoming, or new projects, the URA will be expected to be proficient in **at least one** source of physiological data, including collection and processing.
 - The URA will be expected to attend hands-on training sessions with the mentor, and may be asked to assist in, or lead, training sessions for new URAs / PhD students.

EXPECTATIONS:

URAs are expected to engage with research proactively, taking initiative to pursue topics of interest, have questions answered (by literature or the mentor), and disseminate their research.

- Maintaining consistent communication about project updates or setbacks: The URA will be expected to provide updates to the mentor at least 1 time a week (during weekly meetings) but is expected to communicate with the mentor frequently

(outside of the meeting) about questions or concerns. If any unforeseen circumstances occur, the URA is expected to provide notice to the mentor if they will not be able to accomplish certain work.

- Setting and meeting deadlines: The URA will be expected to set goals on how much work they plan to accomplish in a given period (i.e. weekly, monthly, semester). Deadlines should be reasonable given the other responsibilities of the URA and will be expected to be met unless notice is provided to the mentor **2 days** before the deadline.
- Semester objective: The URA will be expected to provide the mentor with (1) any skills that they would like to build, and (2) any research opportunities they would specifically like to pursue (i.e. poster presentations, paper writing, independent project, etc.). Additionally, the URA will be expected to set **at least one** overall goal objective for their work per semester.
- Honesty and Integrity: Most importantly, the URA is expected to be honest and transparent about their skills, AI usage, data analysis, availability, and time spent doing work related to their URA responsibilities.

TIME COMMITMENT:

Before starting a paid position, the URA will coordinate with their mentor to determine the average, weekly time commitment that will be expected of them. **If the URA is not able to work the agree upon hours in any given week, they may contribute additional hours in a subsequent week.**

Agreed upon weekly time commitment (average hours): **10**

MENTOR EXPECTATION:

- Scope the work so that the URA can both engage with research that interests them and develop a diverse scientific toolkit.
 - Including supporting the analysis and collection of physiological data.
- Provide in-depth explanations of high-level topics in HAI, HRI, HAT, neuroscience, cognitive psychology, and human factors, which will support independent exploration.
- Provide seminal literature that the URA should be familiar with before performing their own independent literature review.

- Provide suggestions regarding overall direction of the research (topics to focus literature review around, analysis to be performed, etc).
